

Scope and Limitations

Introduction

This section outlines the scope and limitations of the present study/project. Clearly defining the boundaries helps to set expectations regarding what will and will not be covered in the investigation. The scope defines the extent of the study, specifying its parameters and focus areas, while the limitations explain the constraints and factors that may affect the results or generalizability of the findings.

Scope

The scope of this document includes the objectives, subject matter, and coverage of the study. It identifies the following key aspects:

- The primary purpose and specific goals of the project/study.
- The population or samples considered for the study.
- The geographical and time boundaries.
- The methodologies and tools used.

Limitations

This document also details the limitations that may impact the outcomes. These may include:

- Constraints related to resources, data availability, or access.
- Methodological limitations or potential biases in data collection.
- Time restrictions affecting the scope of analysis.
- Any uncontrollable variables or external dependencies.

Important Notes

- This section helps readers understand where the focus lies and why certain areas are excluded.
- Being transparent about limitations adds credibility and context to the results.
- Scope and limitations should be carefully aligned with the project's objectives and methodology.
- Limitations do not indicate failure, but acknowledge challenges and context for interpretation.
